

Contents

Preface vii

1	Fundamentals of Bacterial and Viral Genetics	1
	Nomenclature	2
	Prokaryotic Cells and Eukaryotic Cells	5
	Structure	5
	Ploidy	8
	DNA Structure	10
	Chromosome Structure	13
	Eukaryotes	13
	Prokaryotes	15
	Selection: An Essential Element of Microbial Genetics	22

Contents

Major Genetic Transfer Processes Observed in Microorganisms and Their Viruses	23
Genetic Transformation	23
Transduction	24
Conjugation	25
Protoplast Fusion	25
Electroporation	26
Bacteriophage Genetic Exchange	26
Summary	27
Questions for Review and Discussion	27
References	27
General	27
Specialized	28
Reference Books for Specific Organisms	29

2 Replication and Analysis of DNA 31

DNA Replication	32
Linking DNA in Arbitrary Ways	42
Enzymology of DNA Restriction and Modification	43
Use of Restriction Fragments to Make New DNA Molecules	47
Analytical Techniques for DNA Molecules	49
Electrophoresis	49
Atomic Force Microscopy	50
Detection of Specific DNA Sequences	50
Polymerase Chain Reaction	54
DNA Sequence Analysis	56
Custom Synthesis of DNA	61
Footprinting	62
Gel Mobility Shift Analysis	64
Yeast Two-Hybrid Systems	65
Summary	65
Questions for Review and Discussion	66
References	67
General	67
Specialized	68

3 Mutations and Mutagenesis 69

Bacterial Variation	70
Plate Spreading	70

Replica Plating	71
Fluctuation Test	72
Measurement of Mutation Rate	76
Expression and Selection of Mutant Cell Phenotypes	81
Expression	81
Selection	85
Genetic Code	87
Kinds of Mutation	88
Base Substitutions	89
Insertion and Deletion Mutations	92
Frameshift Mutations	93
Suppressors of Mutations	94
Mutagens	97
Radiation	98
Chemical Modifiers	98
Base Analogs	99
Cross-Linking Agents	100
Transposons	100
Mutator Mutations	101
Site-Directed Mutagenesis	101
Summary	103
Questions for Review and Discussion	104
References	104
General	104
Specialized	105
4 Transcription and Translation: Processes and Basic Regulation	107
RNA Structure	108
Transcription	109
RNA Processing	113
Translation of the Genetic Message	116
Ribosome Function	116
Protein Folding	121
Regulation	123
Examples of Regulation in Simple Functional Units	124
Operon: The Basic Regulatory Unit	124
Lactose Operon	125
Galactose Operon	132
Tryptophan Operon	135
Summary	144

Contents

Questions for Review and Discussion	145
Suggestions for Further Reading	145
General	145
Specialized	146

5 DNA Repair and Simple Recombination 149

DNA Repair	150
Mismatch Repair: An Example of Intrareplicative Repair	153
Ultraviolet-Irradiated DNA as a Model Repair System	154
The SOS Global Regulatory Network	157
A Conceptual Model for Generalized Recombination	160
Genetic and Functional Analysis of Recombination	164
RecA and Similar Proteins	164
Other Genes Affecting Recombination	168
A Model for General Recombination	170
Interrelation of Repair and Recombination Pathways	172
Summary	173
Questions for Review and Discussion	174
References	175
General	175
Specialized	175

6 T4 Bacteriophage as a Model Genetic System 177

Morphology and Composition	178
Experimental Methods Used to Study Phage Infection	181
Genetic Organization of T4	186
Types of Mutations Observed in the T4 Genome	186
Genetic Crosses	188
Visconti–Delbrück Analysis	196
Phage Heterozygotes	199
DNA Replication	202
Molecular Biology of T4 Phage Infection	204
Initial Stages of Infection	204
Regulatory Issues	206
Morphogenesis and Maturation	214
Summary	216
Questions for Review and Discussion	217

References 218
 General 218
 Specialized 218

7 Genetics of Other Intemperate Bacteriophages 221

Other Members of the T Series 224
 Bacteriophages T2 and T6 224
 Bacteriophage T1 227
 Bacteriophage T5 228
 Bacteriophages T7 and T3 230
 Bacteriophages Containing Single-Strand DNA 235
 Bacteriophages Belonging to the Ff Group 235
 Bacteriophage ϕ X174 242
 RNA-Containing Bacteriophages 244
 Single-Stranded RNA Viruses 244
 Double-Stranded RNA Viruses 250
 Bacteriophages Infecting *Bacillus subtilis* 251
 Bacteriophage SP01 251
 Bacteriophage ϕ 29 253
 Bacteriophages Infecting the Archaea 255
 Summary 255
 Questions for Review and Discussion 256
 References 257
 General 257
 Specialized 257

8 Genetics of Temperate Bacteriophages 261

General Nature of the Temperate Response 264
 Bacteriophage Lambda as the Archetypal Temperate Phage 265
 Lytic Life Cycle 266
 Temperate Life Cycle 277
 Genetic Map of Lambda 285
 Other Lambdoid Phages 286
 Bacteriophage P22 288
 Bacteriophages P2 and P4 290
 Bacteriophage P1 293
 Bacteriophage Mu 295
 SSV1 and SSV2 299
 Summary 299

Contents

Questions for Review and Discussion	300
References	301
General	301
Specialized	301

9

Transduction	305
Bacteriophage Lambda: A Specialized Transducing Phage	306
Production of Transducing Particles	306
Physiology and Genetic Consequences of Transduction	309
Lambda Phages That Transduce Additional Genetic Markers	310
Specialized Transducing Phages Other than Lambda	310
Bacteriophage ϕ 80	310
Bacteriophage P1	312
Bacteriophage P22	312
Generalized Transduction	314
Bacteriophage P22	314
Bacteriophage P1	317
Other Phages	318
Analysis of Transductional Data	319
Generalized Transduction	319
Specialized Transduction	322
Summary	323
Questions for Review and Discussion	323
References	324
General	324
Specialized	324

10

Genetic Transformation	327
Standard Genetic Transformation Systems	328
Discovery of Genetic Transformation	328
Competent Cells	330
DNA Uptake and Entry	333
Establishment of Donor DNA in the Recipient Cell	335
Other Transformation Systems	339
<i>Escherichia coli</i>	339
Electroporation	340
Transfection	341
<i>E. coli</i> as a Recipient	342
<i>B. subtilis</i> as a Recipient	343

Genetic Mapping Using Transformation	345
Analysis of Transformational Data	345
Genetic Map for <i>B. subtilis</i>	345
Summary	346
Questions for Review and Discussion	349
References	349
General	349
Specialized	350
11 Conjugation and the <i>Escherichia coli</i> Paradigm	351
Basic Properties of the <i>E. coli</i> Conjugation System	352
Discovery of Conjugation	352
Discovery of Efficient Donor Strains and Partial Transfer	353
Nature of the Transfer Process	355
Recombination Following Conjugation	358
Construction of the First Genetic Map	359
Interactions of the F Plasmid with the Bacterial Chromosome	362
Integration of the F Plasmid	362
Excision of the F Plasmid	365
Physiology of Conjugation	367
Formation of Mating Aggregates	367
Transfer DNA Synthesis	370
Analysis of the F Plasmid	373
General Structure	373
Genetic Analysis of the F Plasmid	375
Something Completely Different—Possible Diploidy	379
Summary	379
Questions for Review and Discussion	380
References	381
General	381
Specialized	381
12 Plasmids and Conjugation Systems Other than F	383
Major Chromosome-Mobilizing Plasmids	384
<i>Salmonella</i>	384
<i>Pseudomonas</i>	386
<i>Enterococcus</i>	388
<i>Streptomyces</i>	390

Contents

<i>Agrobacterium</i>	392
<i>Sulfolobus</i>	395
Bacteriocins	396
General Properties	396
Colicins: The Best-Studied Bacteriocins	398
Conjugative Colicin Plasmids	400
Nonconjugative Colicin Plasmids	401
Resistance Plasmids	402
General Properties	402
Plasmid R100	403
Genetic Analysis of Plasmid R100	406
Conjugal Plasmid Interactions	409
Summary	411
Questions for Review and Discussion	412
References	413
General	413
Specialized	414
13 Plasmid Molecular Biology	417
Plasmid DNA Replication	418
Interactions Between Plasmid and Host	418
DNA Replication Processes	420
Control of Copy Number	422
Partitioning	426
Incompatibility	430
Conjugal Functions	431
Pilus Production	431
Transfer DNA Replication	434
Broad Host Range Plasmids	436
Summary	438
Questions for Review and Discussion	439
References	439
General	439
Specialized	440
14 Advanced Regulatory Topics	443
Regulons	444
Maltose	444
Heat Shock Proteins	448

Global Regulatory Networks	450
Nitrogen Regulation	450
Endospore Formation in <i>Bacillus</i>	453
Inteins	457
Small RNA Molecules	458
Summary	458
Questions for Review and Discussion	459
References	459
Generalized	459
Specialized	460

15 Site-Specific Recombination 463

General Principles	464
Double Site-Specific Recombination	464
Phage Lambda Integration	464
Circular Chromosome Segregation	466
Inversion Systems	467
Integrans	468
Transposons: Single Site-Specific Recombination	470
Transposon Tn10	470
Phage Mu Transposition	474
Summary	476
Questions for Review and Discussion	477
References	477
General	477
Specialized	477

16 Applied Bacterial Genetics 479

More Information About Recombinant DNA Technology	480
Restriction Mapping	480
Sources of DNA for Linking	481
Safety Considerations	484
Difficulties with the Expression of Cloned DNA	487
Cloning Vectors	488
Phage λ Vectors	489
Phage M13 Vectors	490
Expression Vectors	491
Broad Host Range Vectors	494

Contents

Runaway Replication Vectors	494
Artificial Chromosomes	495
Applications of DNA Cloning	496
Peptide Display Systems	496
Laboratory Reagents	497
Phage as Therapeutic Agents	498
Other Applications of Bacterial Genetics	498
Mutagenicity Testing	498
Recombineering	500
Genetic Transfer in Nature	501
Ecogenomics	501
Summary	502
Questions for Review and Discussion	502
References	503
General	503
Specialized	503

17 Bacterial and Bacteriophage Evolution 505

What Is Evolution?	506
Implications of Strain Differences	506
Cryptic Genes	507
Expression of Evolutionary Relationships	510
Genomics and Proteomics	519
Bacteria	519
Bacteriophage	520
Specific Examples of Evolution	520
Evolution of Genomes	521
Evolution of the Genetic Code	522
Evolution of Proteins	522
Evolution of Regulatory Sequences	523
Evolution of Mitochondria and Other Endosymbionts	523
Genetic Structure of the Chromosome	525
Bacteria	525
Bacteriophage	526
Summary	526
Questions for Review and Discussion	527
References	528
General	528
Specialized	529

Contents

Appendix 1	Laws of Probability and Their Application to Prokaryote Cultures	531
Appendix 2	Useful World Wide Web Sites for Bacterial Genetics	549
Appendix 3	Answers to Application Questions	551
